EXPERIMENT 11

Deploying a Zoho Creator Application from Development to Stage and Production Environments

Application: Patient Appointment Scheduling System | Zoho Creator

Saranya V. | Register No: 2116241501188 | AIML | Rajalakshmi Engineering College

Abstract

This experiment documents the deployment flow for the Patient Appointment Scheduling System in Zoho Creator. The application contains an Appointment Booking Form, reports, a dashboard and workflows. The deployment menu screenshot shows options for Development Live, Stage Live, Production Live and deployment. The procedure describes how to test the application in Development, promote a stable version to Stage for pre-release testing, and then deploy it to Production. The report distinguishes available screenshot evidence from deployment steps that must be verified in the live account.

1. Aim

To understand and document the process of deploying the Patient Appointment Scheduling System from the Development environment to Stage and then to Production in Zoho Creator.

Execution Note

Execution note: the screenshots show the available deployment menu and the current application pages, but they do not prove that a new release was successfully deployed to Stage or Production. If a plan restriction or confirmation dialog prevents deployment, record that limitation and do not state that the deployment completed.

2. Concepts

Environments

Development is used to build and test application changes. Stage is used to test a release before it reaches real users. Production is the live environment used by the intended users.

Deployment

Deployment promotes the application structure—such as forms, reports, pages and workflows—from one environment to another. The environments may have separate URLs and data.

Why deployment environments matter

Changes can be tested before they affect the live application. The tested version can be promoted in a controlled release, while later changes remain in Development until deployed.

Application components

For this project, the release should include the Appointment Booking Form, Doctor Master and Family Member forms, the appointment report, dashboard components and relevant workflows such as Auto-Calculate Net Fee and Validate Treatment Consent.

3. Procedure

1. Open the Patient Appointment Scheduling System in Zoho Creator and select the application menu.

2. Choose Access Development Live and open the Development version of the application. Confirm that the Development environment is indicated in the page or URL, if shown.

3. Test the Appointment Booking Form by checking its fields and submitting a test record if permitted. Open the report and confirm the record appears. Review the dashboard and existing workflows.

4. Return to the application menu and choose the deployment option for Stage, if it is enabled in the account.

5. Review the list of components to be deployed. Add a release description such as Release 1 – Appointment Scheduling System, then confirm the deployment.

6. Open Stage Live and repeat the form, report, dashboard and workflow checks using test data. Resolve issues before promoting the release.

7. From the Stage environment, choose Deploy to Production, review the component list and confirm only after the Stage checks pass.

8. Open Production Live and verify the application URL/environment, forms, reports, dashboard and workflows. Use Production for the approved live version; make future changes in Development and deploy them through Stage again.

4. Pre-Deployment Test Checklist

• Appointment Booking Form opens and required fields validate correctly.

• Appointment records can be saved and displayed in the report.

• Dashboard components load and show meaningful values for populated fields.

• Auto-Calculate Net Fee and Validate Treatment Consent workflows work as intended.

• Doctor Master and Family Member components are available to authorized users.

• Stage testing is completed before the Production deployment.

5. Implementation Screenshots

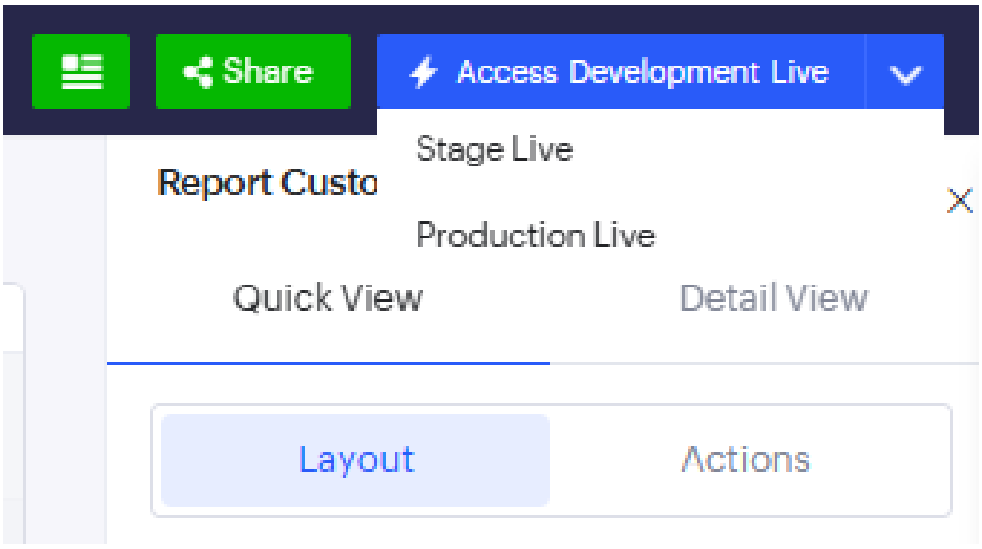

Figure 1: Application access/deployment menu showing Development Live, Stage Live, Production Live and deployment options.

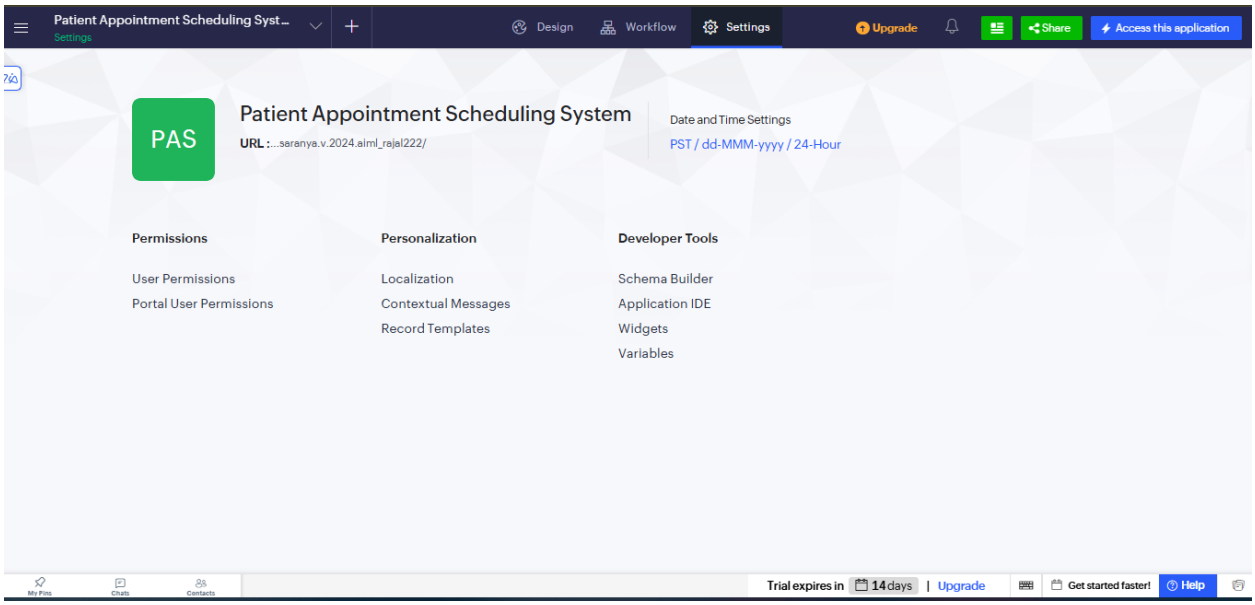

Figure 2: Patient Appointment Scheduling System application settings page.

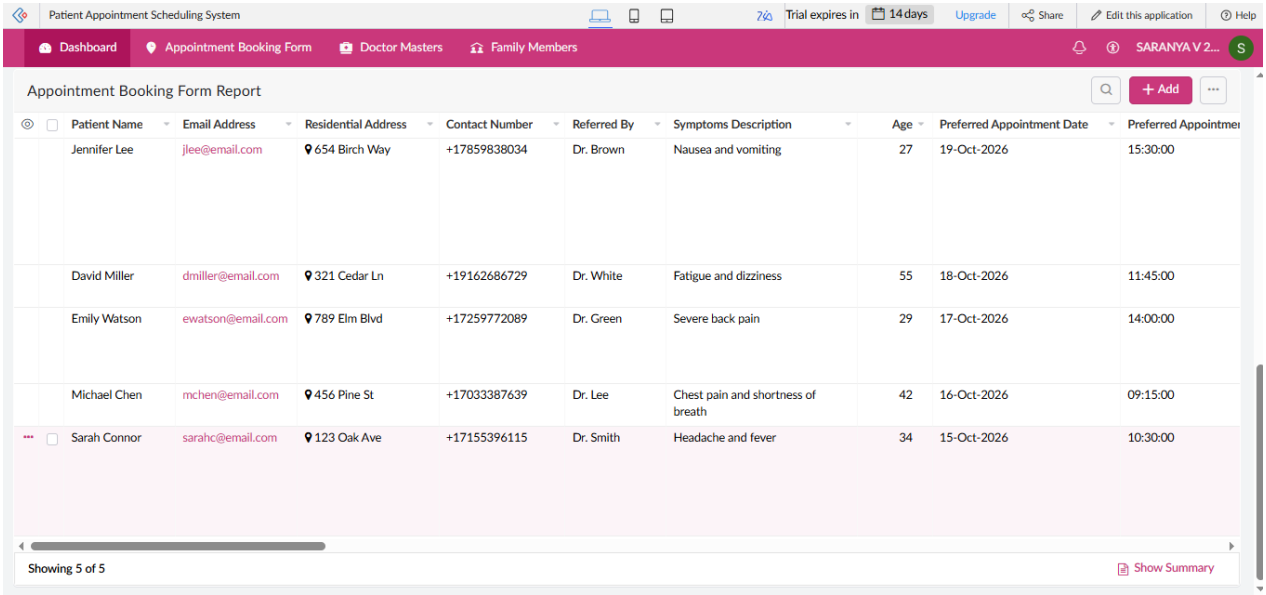

Figure 3: Appointment Booking Form Report showing saved sample appointment records.

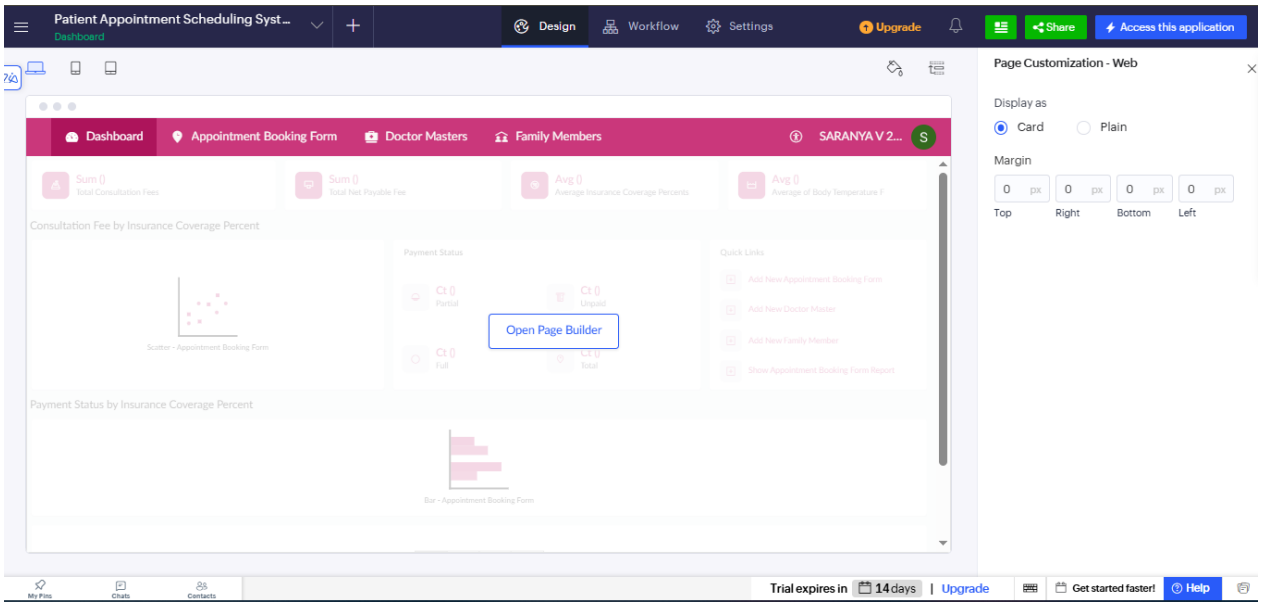

Figure 4: Dashboard design for the Patient Appointment Scheduling System.

6. Expected Output

The application structure should be available in Stage after a successful Development-to-Stage deployment, and in Production after a successful Stage-to-Production deployment. Each environment should be tested using its own live view and URL. Actual availability depends on the account's deployment permissions and plan.

7. Result

The Development → Stage → Production release procedure was documented for the Patient Appointment Scheduling System using the available application screenshots. The deployment menu is visible in the supplied evidence. A completed deployment to Stage or Production is not claimed because no successful deployment confirmation or live Stage/Production test screenshot was supplied.

8. Learning Outcome

Learnt the purpose of Development, Stage and Production environments, how to access the live version of an application, how forms/reports/pages/workflows are considered during deployment, and why Stage testing should precede a Production release.
