Low-Code Experiment

Data Modelling and Form Design for a Patient Appointment Scheduling System

Abstract

This experiment documents the design and testing of a Patient Appointment Booking Form in Zoho Creator. The form collects patient details, contact information, medical information and appointment scheduling preferences. It uses the basic field types, groups fields into sections, applies required-field validation and displays submitted appointments in a report.

1. Aim

To design a Patient Appointment Booking Form in Zoho Creator using basic field types, organize the fields into clear sections, apply appropriate validations and view submitted appointment records in a report.

2. Introduction

A clinic needs a structured way to record patient details and appointment requests. A single form can collect patient identity, contact information, symptoms and the preferred appointment date and time. In Zoho Creator, each form field contributes to the application's data model, while reports provide a view of submitted records.

3. Form Design

The appointment form is organized into four sections: Patient Details, Contact Information, Medical Information, and Appointment Scheduling. The key fields include Patient Name, Age, Gender, Email Address, Contact Number, Residential Address, Referred By, Department, Existing Conditions, Symptoms Description, Preferred Appointment Date, Preferred Appointment Time and Consent for Treatment.

4. Procedure

Step 1: Form layout and sections. The first three images below are illustrative, pink-accented builder mockups adapted from the supplied reference screenshots. They are not actual captures of your current application; use them as layout guidance and capture fresh screenshots from your own Zoho Creator builder for final evidence.

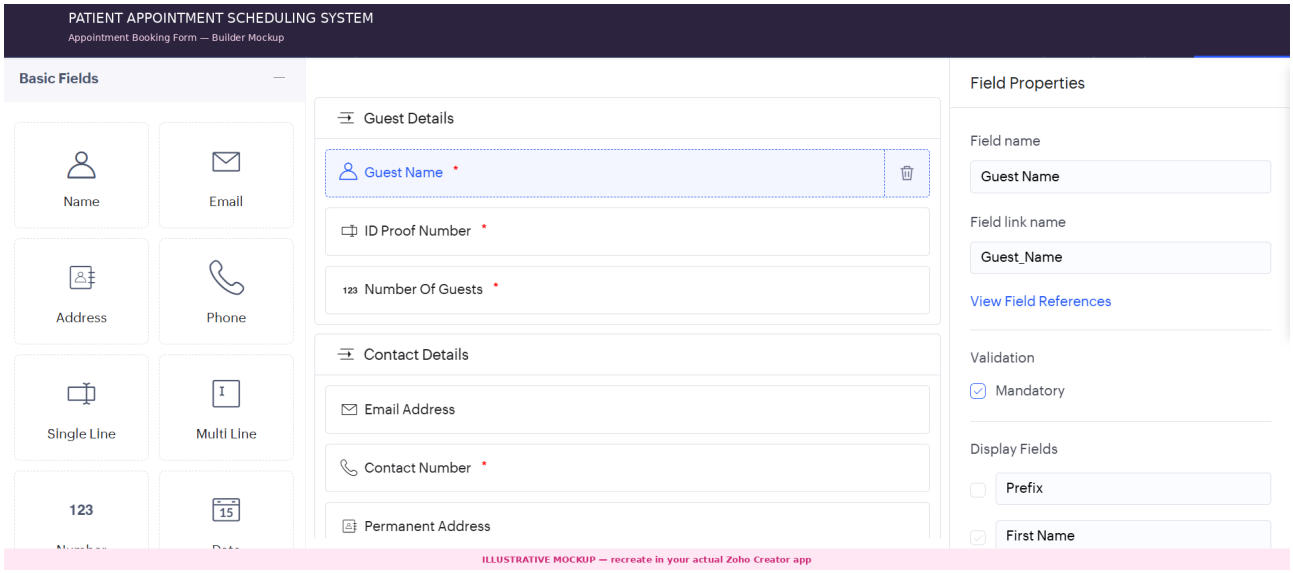

Figure 1: Appointment Booking Form builder — illustrative mockup

Step 1 (continued): Organizing fields. Group patient and contact fields separately from medical information and appointment scheduling. Keep field labels readable and make required fields clearly identifiable.

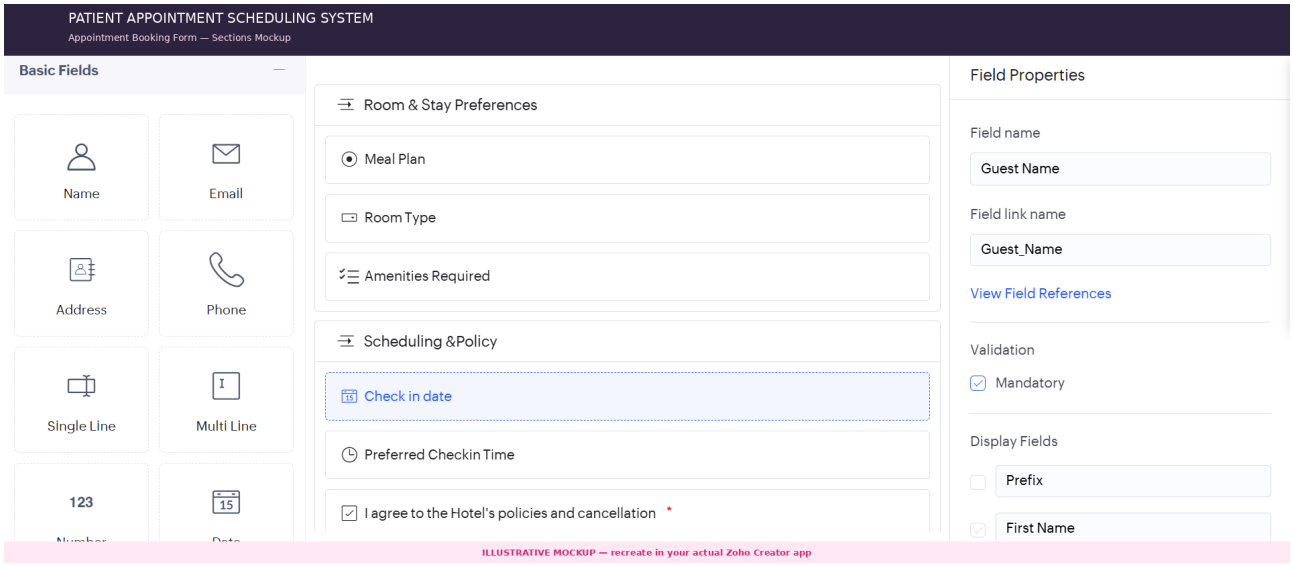

Figure 2: Appointment form sections — illustrative mockup

Step 2: Field properties and validation. Review each field's display name and link name. Mark required fields as mandatory and configure appropriate validation for age, email, phone number, appointment date and consent.

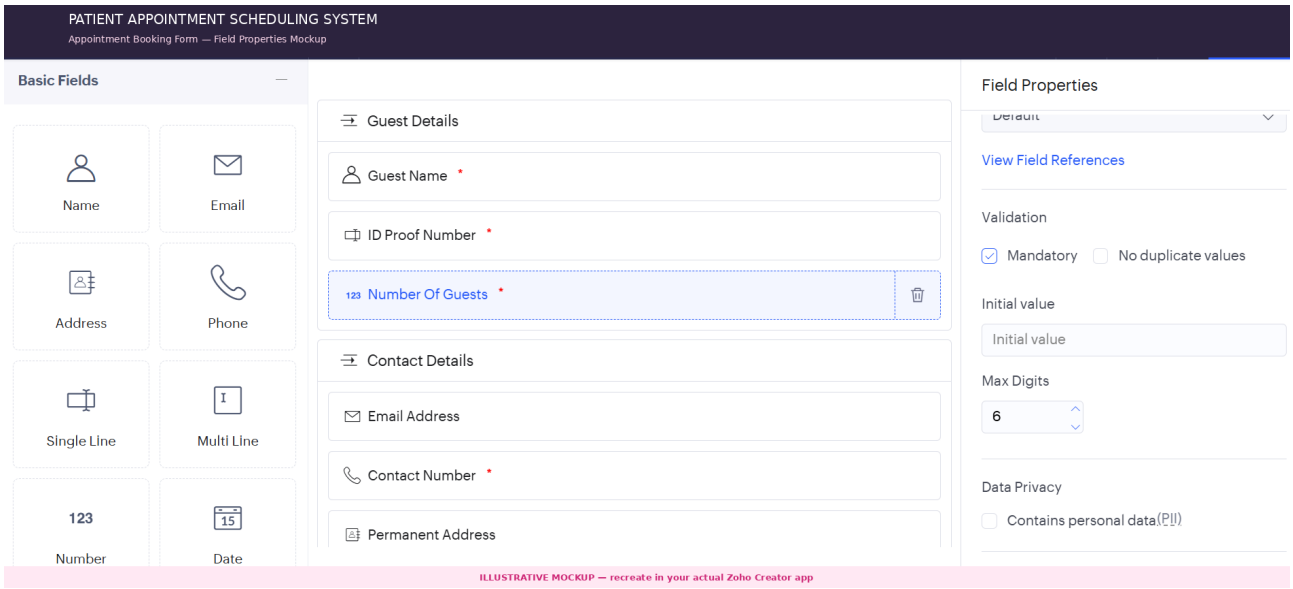

Figure 3: Field properties — illustrative mockup

Step 3: Preview the live form. The supplied screenshot shows the Patient Appointment Scheduling System's Appointment Booking Form with patient, contact, symptom and scheduling fields.

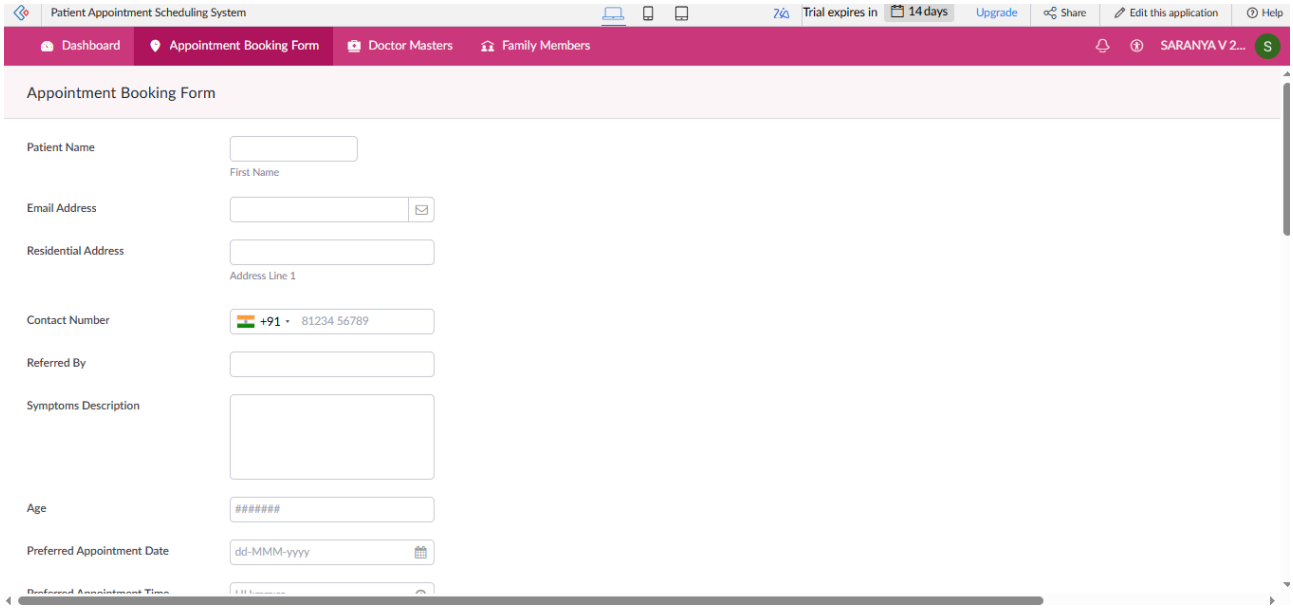

Figure 4: Live Patient Appointment Booking Form

Step 4: Test mandatory-field validation. The supplied screenshot shows the form blocking submission until consent for treatment is provided.

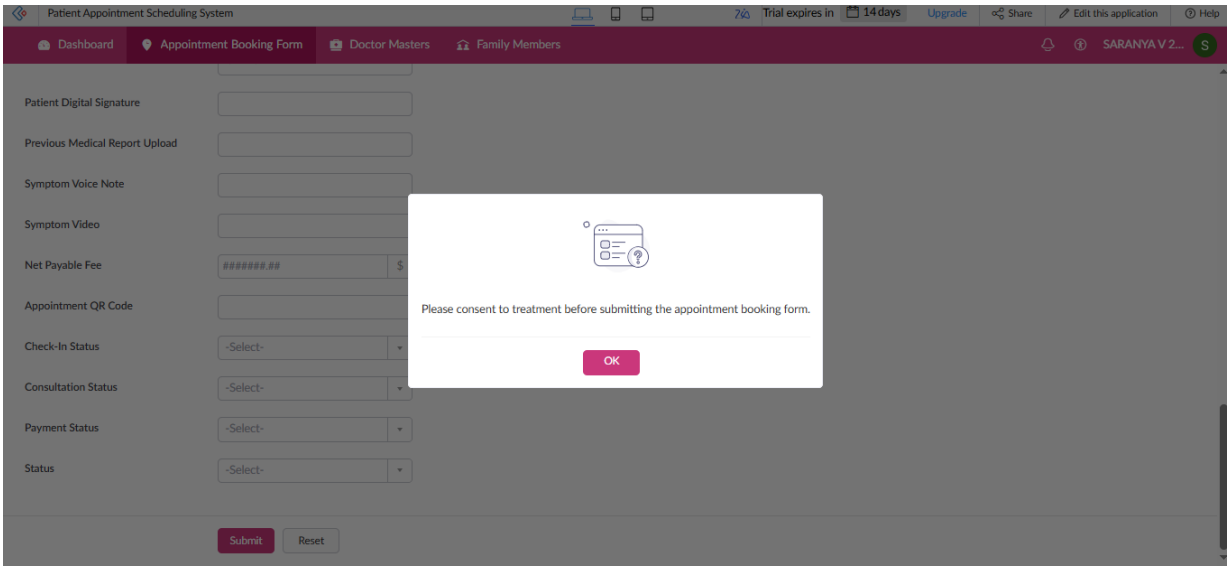

Figure 5: Consent validation message

Step 5: View submitted records. The appointment report displays sample records and fields such as patient name, email, residential address, contact number, symptoms, age, preferred appointment date and preferred time.

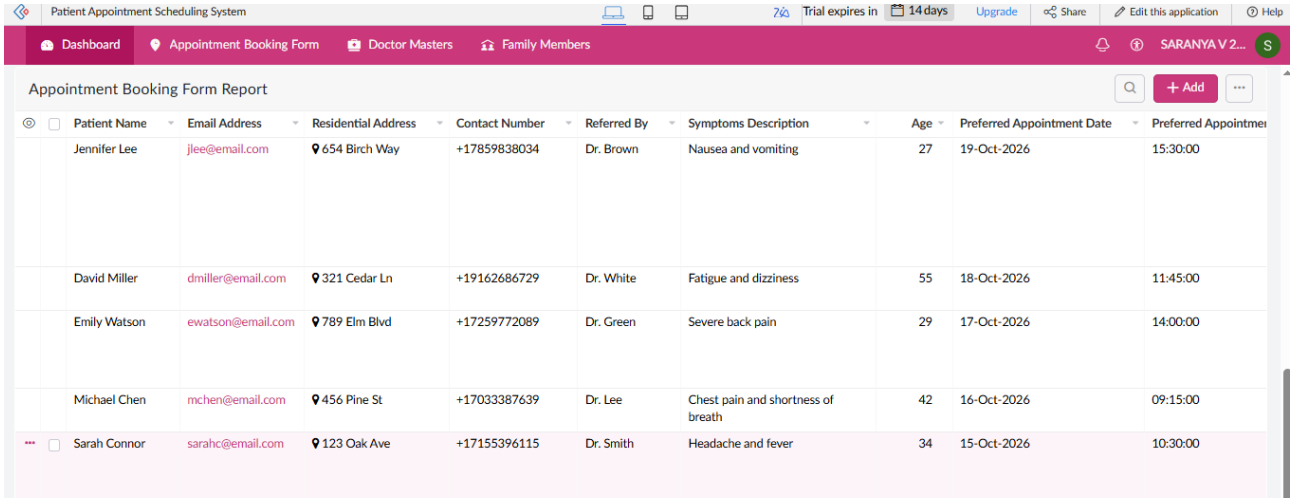

Figure 6: Appointment Booking Form report with sample records

5. Validations Applied

Field	Validation
Patient Name, Age, Gender, Contact Number, Department and Preferred Appointment Date	Mandatory
Consent for Treatment	Mandatory; submission is blocked until consent is given
Email Address	Built-in email-format validation
Contact Number	Phone field configured for the appropriate country code
Age and appointment date	Age within the defined range; past appointment dates rejected where configured

6. Result

The Patient Appointment Booking Form is available in Zoho Creator, and the supplied live-form, validation and report screenshots demonstrate key parts of the workflow. The first three builder images in this document are explicitly illustrative mockups and should be replaced with genuine screenshots of the final form builder before submission.

7. Conclusion

A well-designed form provides structured data entry and supports accurate reporting. Grouping related fields, choosing appropriate field types and applying validation helps make the appointment process clearer for patients and clinic staff.

8. Learning Outcome

This experiment develops practical understanding of form design, data modelling, field validation and report viewing in Zoho Creator, applied to a patient appointment scheduling workflow.
