Experiment 5

Building Reports, Dashboards and Custom Pages (UI Builder) for the Application

Low-Code Lab | Application: PATIENT APPOINTMENT SCHEDULING SYSTEM (Zoho Creator)

Name: Saranya V. Register No: 2116241501188 Department: AIML Rajalakshmi Engineering College

Abstract

This experiment extends the Patient Appointment Booking Form by using report views and the Zoho Creator UI Builder dashboard. The Appointment Booking Form Report is viewed in list, calendar, tabular, Kanban and map formats. The dashboard contains summary panels, chart components, a payment-status panel and quick links to the app's forms and report. These elements provide different ways to inspect appointment records and access common tasks.

1. Aim

To create and inspect reports and a dashboard in Zoho Creator for the Patient Appointment Scheduling System, and to present appointment records through multiple report views and dashboard components.

2. Reports Created / Report Views

The Appointment Booking Form Report was inspected in the following views:

3.1 List View

The list view displays appointment details in rows, including patient name, email address, residential address, contact number, referred-by field, symptoms, age, preferred appointment date and time. The screenshot shows five sample records.

3.2 Calendar View

The calendar view places appointment records on their preferred dates. The displayed month is October 2026, with sample appointment entries shown on the calendar.

3.3 Tabular View

The tabular view presents the appointment records in a compact grid, making it possible to compare fields across records.

3.4 Kanban View

The Kanban view groups records into status columns such as Checked-In, Consulted, Cancelled and Pending. The displayed sample records are arranged according to their current status.

3.5 Map View

The map view displays a map interface with a location search box and map-layer controls. The screenshot demonstrates the map report interface; it does not by itself verify that every record has a valid geocoded location.

3. Dashboard Design (UI Builder)

The dashboard was opened in the Design tab and edited using the UI Builder. The page includes summary cards for consultation fees, net payable fees, average insurance coverage and average body temperature. It also includes chart areas, a payment-status panel and quick links for adding appointment records, doctor masters and family members, or opening the Appointment Booking Form Report. The dashboard screenshots show some values as Sum(), Avg() or Ct() placeholders. These should be treated as configuration/display placeholders rather than confirmed real totals until the underlying fields and aggregations are verified.

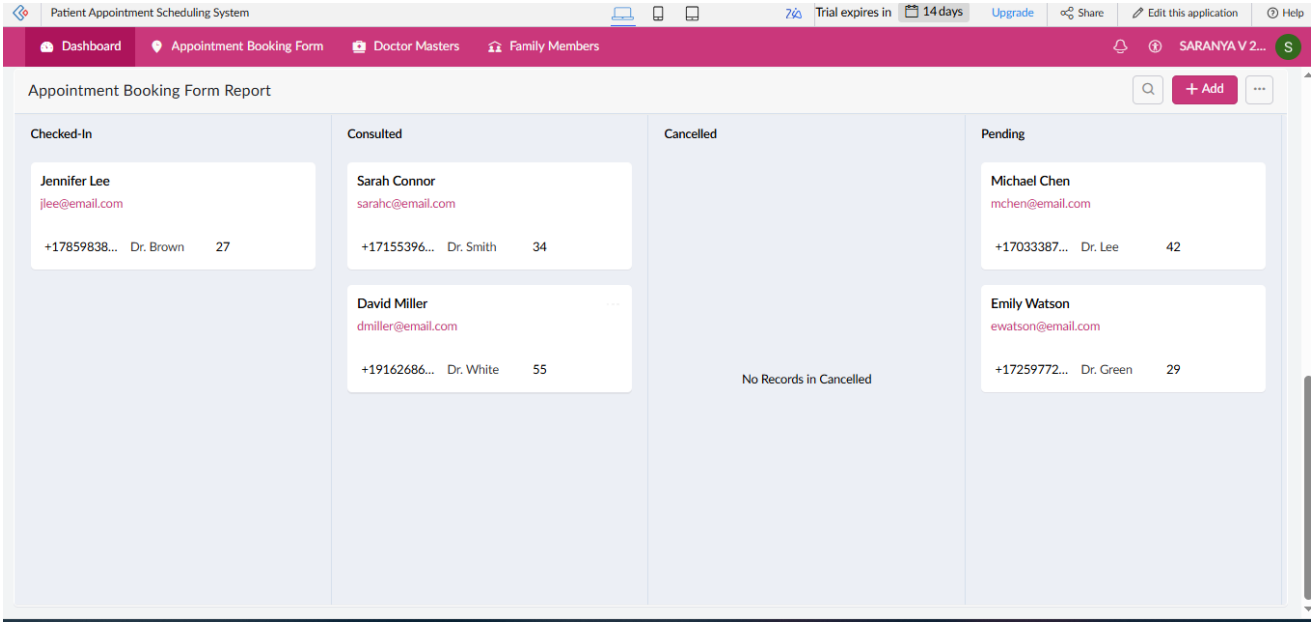

Figure 7. Appointment Booking Form Report in Kanban view grouped by appointment status.

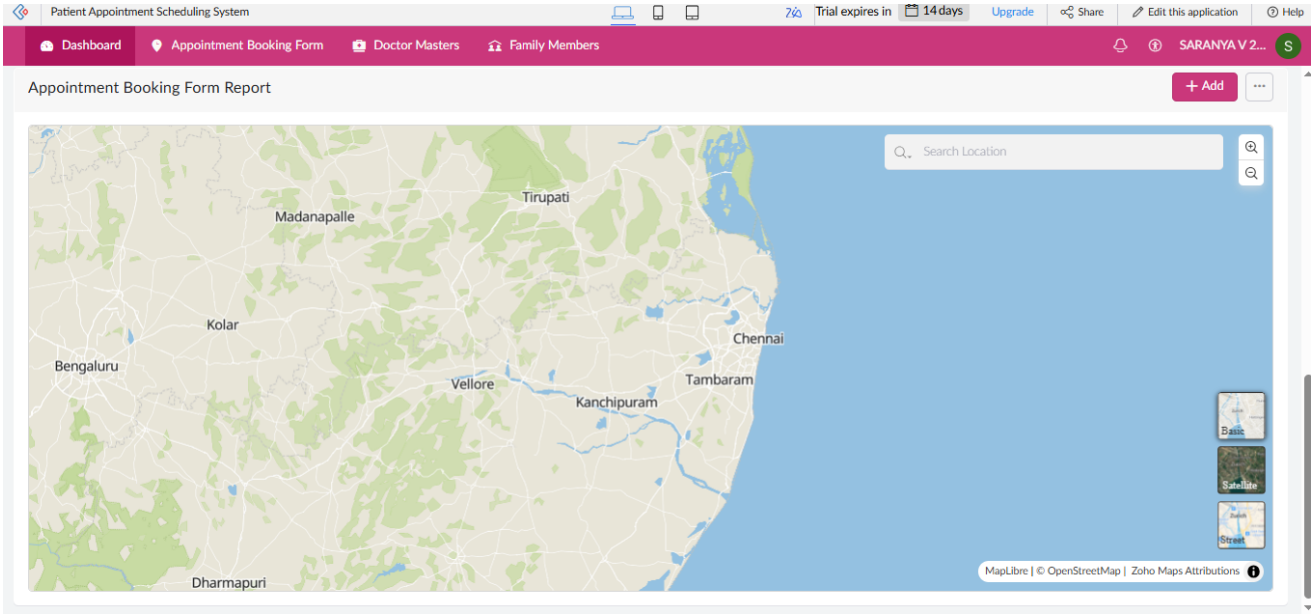

Figure 8. Appointment Booking Form Report in map view.

5. Result

The Appointment Booking Form Report was reviewed in multiple views, and a dashboard layout was assembled in the Zoho Creator UI Builder. The supplied screenshots show five sample appointment records and the available report/dashboard components. Some dashboard cards and chart values remain placeholders or empty counts in the screenshots, so their numerical output should be validated by checking each component's data source, field and aggregation settings.

6. Learning Outcome

Learnt how to view form data in list, calendar, tabular, Kanban and map reports, and how to use the Zoho Creator UI Builder to arrange dashboard panels, charts and quick links. Also learnt that dashboard metrics depend on correctly configured fields and aggregations.
