Experiment 6

Workflow Automation and Workflow Options for the Application

Low-Code Lab | Application: PATIENT APPOINTMENT SCHEDULING SYSTEM (Zoho Creator)

Name: Saranya V. Register No: 2116241501188 Department: AIML Rajalakshmi Engineering College

Abstract

This experiment documents the workflow automation layer of the Patient Appointment Scheduling System in Zoho Creator. The current application includes an Auto-Calculate Net Fee form workflow, a Validate Treatment Consent form-submission validation workflow, and an Appointment Approval Workflow blueprint. Additional automation options, such as appointment reminders and reusable processing functions, are proposed for future implementation where appropriate.

1. Aim

To configure and document Zoho Creator workflow options for the Patient Appointment Scheduling System, including form-load calculations, treatment-consent validation, appointment approval stages, and proposed reminder automation.

2. Objective

Workflows help automate repetitive form operations, validate submitted information, and manage appointment processing. For this application, the focus is on calculating net payable fees, validating treatment consent, and representing an appointment approval process.

3. Workflow Mapping Overview

Workflow type	Workflow name / purpose	Status based on supplied screenshots
Form workflow	Auto-Calculate Net Fee — calculates the net payable fee when the Appointment Booking Form loads.	Enabled; visible in workflow list
Form validation	Validate Treatment Consent — checks treatment consent during form submission.	Enabled; visible in workflow list
Blueprint	Appointment Approval Workflow — represents the appointment approval/lifecycle process.	Enabled; visible in Blueprint list
Schedule (proposed)	Appointment_Reminder — identify upcoming appointments and notify the responsible user if notifications are configured.	Proposed; not shown as implemented
Form workflow (proposed)	Update_Appointment_Status — update appointment status at an appropriate form event after the status logic is defined and tested.	Proposed; not shown as implemented
Function (proposed)	Appointment_Processing_Function — reusable logic for appointment-related validation or processing after safeguards are defined.	Proposed; not shown as implemented

4. Detailed Workflow Configurations

4.1 Form Workflow — Auto-Calculate Net Fee

Auto-Calculate Net Fee is listed under the Appointment Booking Form workflows and is enabled. The supplied editor screenshot shows a Deluge script under “Created > Load of the form.” The visible script reads consultation_fee and insurance_coverage_percent from the form input. The rest of the script is not fully visible in the screenshot, so this report does not assume a specific formula or claim a particular calculated value.

4.2 Form Validation — Validate Treatment Consent

Validate Treatment Consent is listed as an enabled workflow under “Created or Edited > Validations on form submission.” Its purpose is to ensure the consent-related information is checked before the appointment record is submitted. The supplied screenshot confirms that the workflow exists and is enabled; it does not show a test result, so successful validation should be verified in the live form.

4.3 Blueprint — Appointment Approval Workflow

The Blueprint tab shows an enabled blueprint named Appointment Approval Workflow for the Appointment Booking Form. A blueprint can be used to control an appointment's progression through defined stages. Suggested stages for this project are Pending Review, Approved, Rejected, and Completed. Only configure transitions that match the fields and actions available in the application.

4.4 Proposed Schedule — Appointment_Reminder

A scheduled reminder workflow could be added later to identify upcoming appointments and notify the responsible staff member. This is a proposed enhancement; the supplied screenshots do not show a schedule already configured.

4.5 Proposed Function — Appointment_Processing_Function

A reusable function could later centralize common appointment-processing logic. It should only be added after the relevant fields, status transitions, and duplicate-processing safeguards are defined and tested.

5. Evidence Screenshots

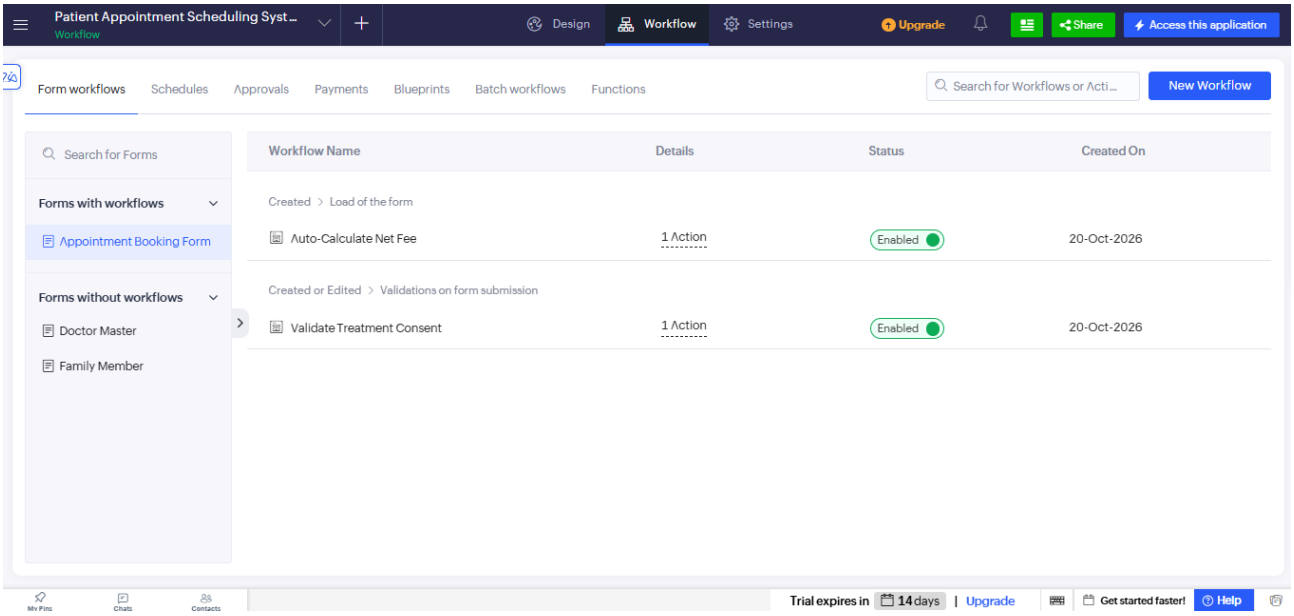

Figure 1: Form workflows configured for the Appointment Booking Form.

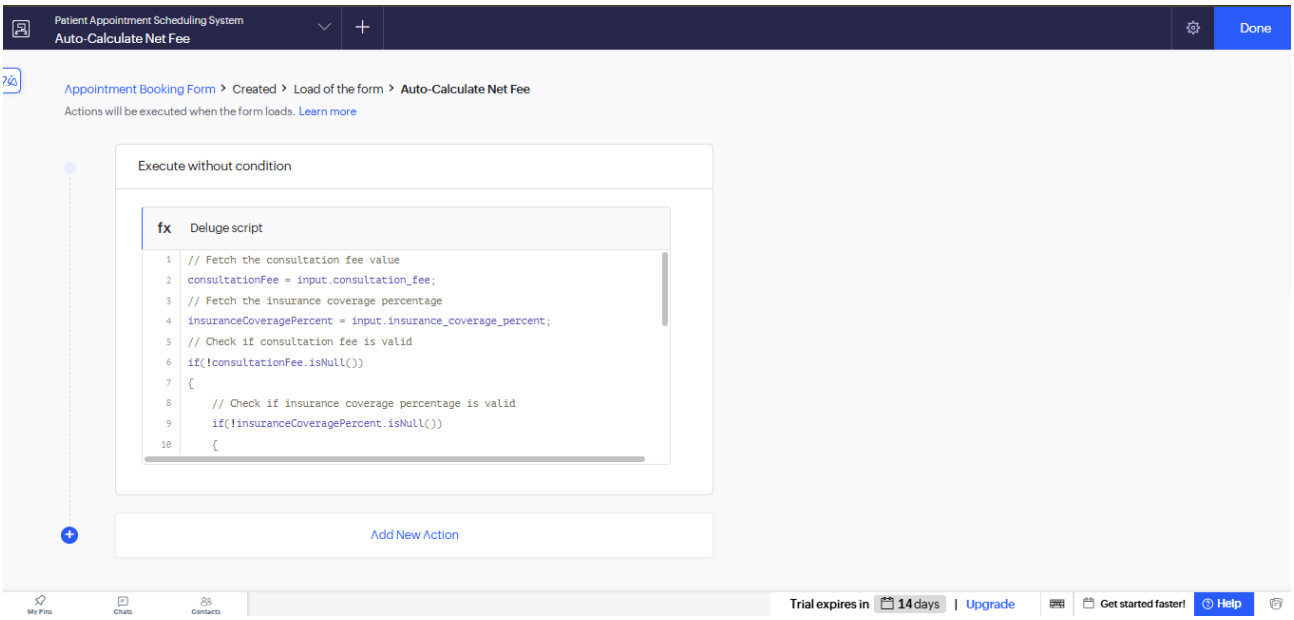

Figure 2: Auto-Calculate Net Fee workflow showing its Deluge script in the Load of the form event.

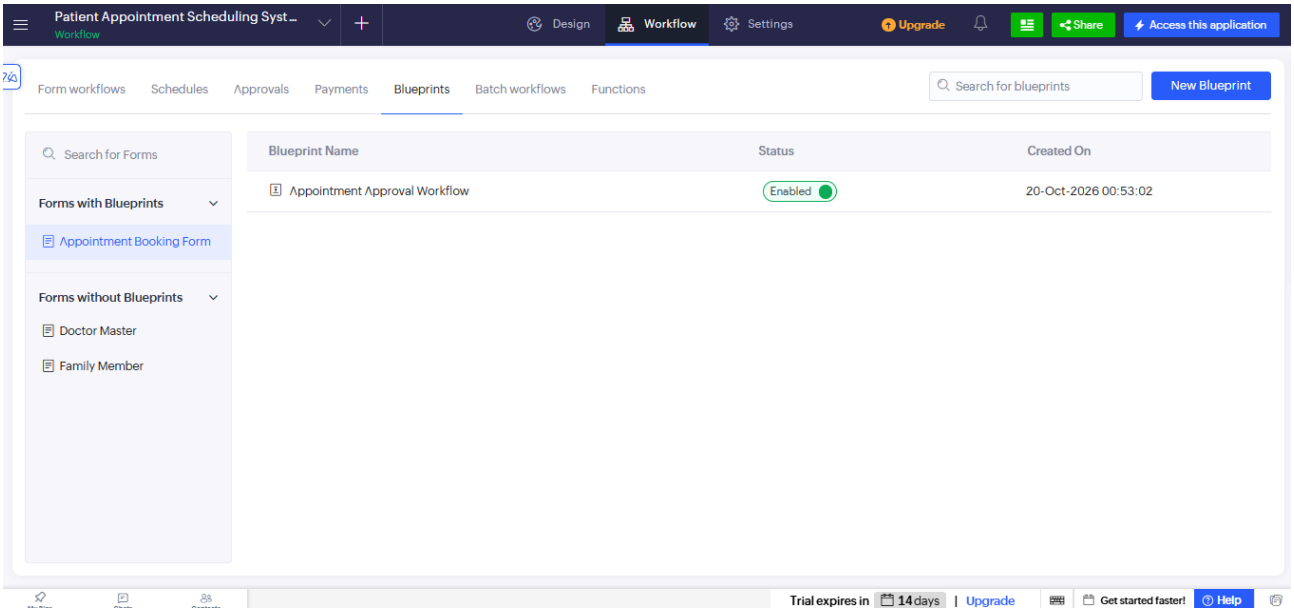

Figure 3: Blueprint list showing the enabled Appointment Approval Workflow.

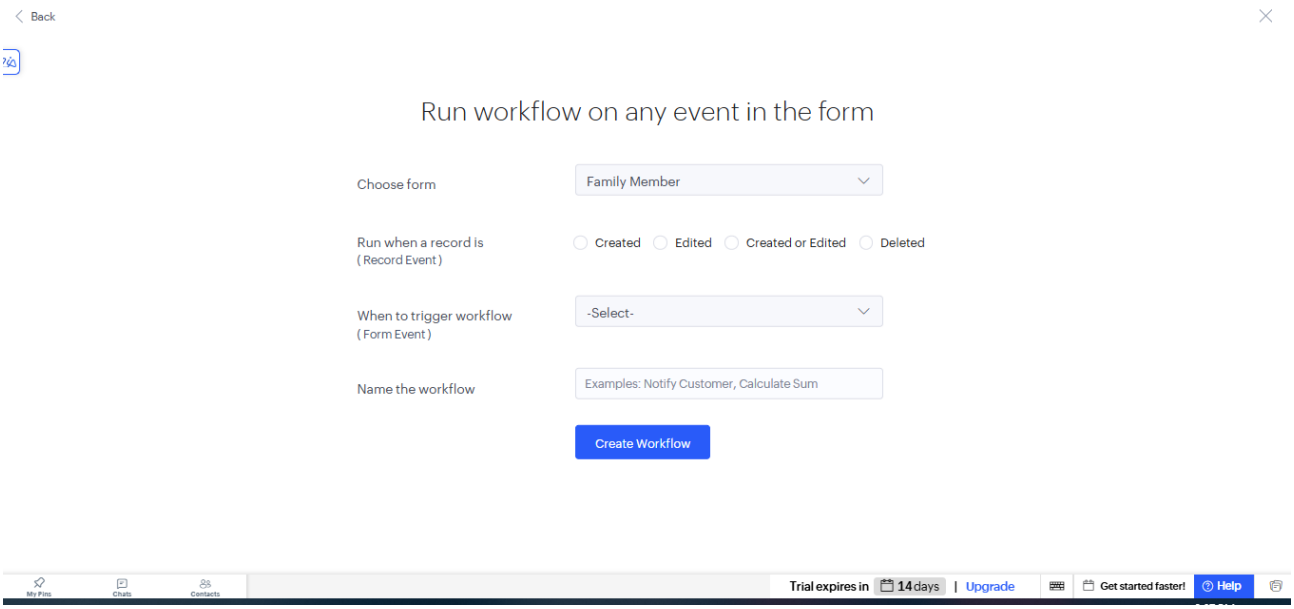

Figure 4: New form workflow setup screen. This screen is shown as an in-progress configuration, not a completed workflow.

6. Result

The supplied screenshots show two enabled form workflows—Auto-Calculate Net Fee and Validate Treatment Consent—and an enabled Appointment Approval Workflow blueprint. The screenshots also show the form-workflow creation screen in progress. Reminder scheduling and reusable processing logic are documented as proposed enhancements rather than completed features.

7. Learning Outcome

Learnt how Zoho Creator form workflows can run on form events, how validation can be attached to form submission, and how a Blueprint can represent a controlled approval process. Also learnt to distinguish enabled workflows from proposed automation that still needs configuration and testing.
