EXPERIMENT 9

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

Application: Patient Appointment Scheduling System | Zoho Creator

Saranya V. | Register No: 2116241501188 | AIML | Rajalakshmi Engineering College

Abstract

This experiment explores the AI-assisted features and built-in analytics available in Zoho Creator, using the Patient Appointment Scheduling System. The existing Appointment Booking Form, report and dashboard design were reviewed. The dashboard includes summary cards, a payment-status panel, quick links and chart components intended to summarize appointment and fee information. Zia-assisted form creation and analytics availability depend on the account plan, configured AI/LLM settings and enabled features.

1. Aim

To explore Zia-assisted features and built-in analytics in Zoho Creator and relate them to the Patient Appointment Scheduling System.

2. Introduction

Zoho Creator is a low-code platform that provides forms, reports, pages and workflows. Zia is Zoho's AI assistant and can assist with application/form creation and other AI-supported features when enabled for the account. Built-in analytics such as charts, summary panels and reports can present information collected through forms. In this project, the appointment form collects patient and appointment details, the report displays saved records, and the dashboard layout contains summary and chart components.

3. Concepts

Zia and AI-assisted creation

Zia can help create or modify supported application components through natural-language instructions when the account has access to the feature. Availability can depend on the Zoho Creator plan, enabled features and configured AI/LLM settings. The current screenshots do not show a completed Zia-generated change, so this report records Zia as a feature to explore rather than claiming it was successfully used.

Form builder and field properties

The Appointment Booking Form contains fields such as Patient Name, Email Address, Residential Address, Contact Number, Referred By, Symptoms Description, Age, Preferred Appointment Date and Preferred Appointment Time. Field properties control names, link names, mandatory status, validation and display behaviour.

Built-in analytics

Dashboard panels, summary cards and charts can summarize form data without requiring a separate analytics application. The current dashboard design includes consultation-fee and net-payable-fee cards, average insurance-coverage and body-temperature cards, a payment-status panel, quick links, and scatter/bar chart components.

Reports as the data source

The Appointment Booking Form Report displays saved appointment records. Analytics are meaningful only when the chart source, category/grouping field and aggregation are configured to match the form fields and the records contain usable values.

4. Procedure

1. Open the Patient Appointment Scheduling System in Zoho Creator and select Design.

2. Open Appointment Booking Form and review the fields used to collect patient details, symptoms and preferred appointment schedule. Inspect field properties where needed, such as mandatory status and field link names.

3. Locate the Zia option in the Creator interface, if it is available to the account. Open it and read the access or setup message shown. If an upgrade or configuration notice appears, record that as the observed result rather than claiming AI generation succeeded.

4. Open the Dashboard page in the page builder. Review the summary cards, payment-status panel, quick links and chart components already placed on the page.

5. Open the live application and view Appointment Booking Form Report. Confirm that saved appointment records appear in the report.

6. Review each chart's configuration: select the Appointment Booking Form as its data source, choose an appropriate category such as appointment status or preferred date, and select a suitable numeric aggregation such as consultation fee only if that field is available and populated.

7. Check the dashboard output. If cards show Sum() / Avg() or counts show Ct() with empty values, verify the selected fields, aggregation, and sample data. Save changes only after confirming that the output represents the intended information.

8. Record the observed state and take screenshots of the form, dashboard and report for the experiment.

5. Observations

The supplied screenshots confirm that the application has an Appointment Booking Form, a report containing five sample appointment records, and a dashboard layout with summary cards, quick links and chart components. The dashboard-builder screenshot shows some values as Sum(), Avg() and Ct(), so those components may need their data fields or aggregation settings checked before they can be treated as populated analytics. The screenshots supplied do not show a Zia-generated app or a Zia access/upgrade popup for this specific application; therefore, no such screenshot or successful Zia action is claimed here.

6. Implementation Screenshots

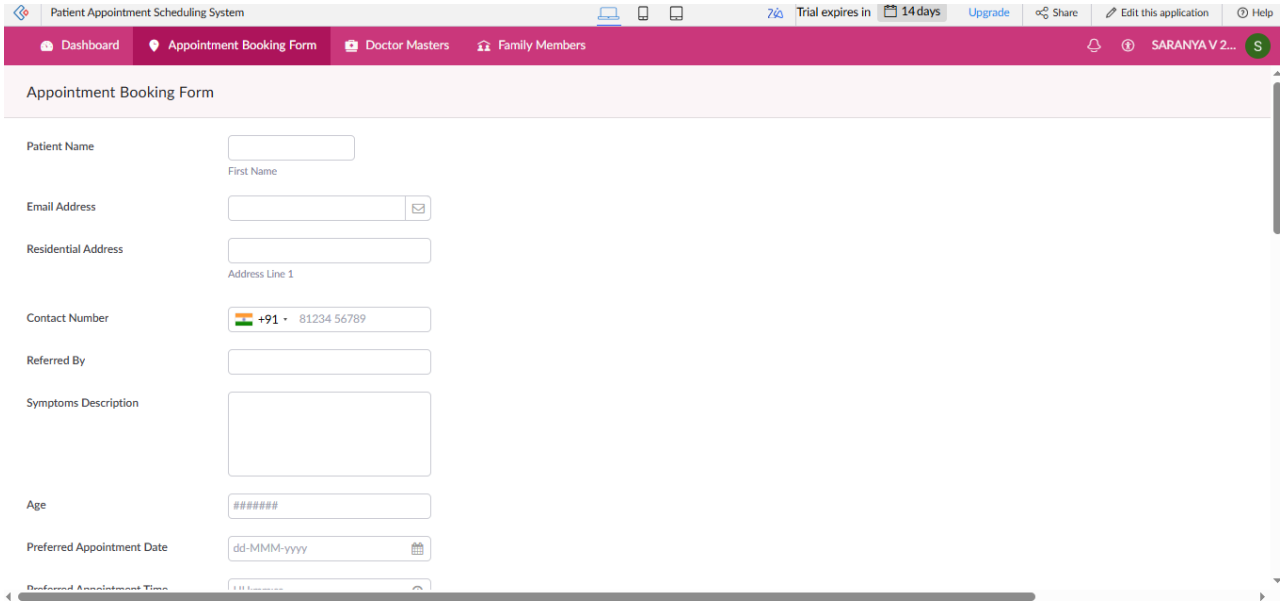

Figure 1: Appointment Booking Form in the Patient Appointment Scheduling System.

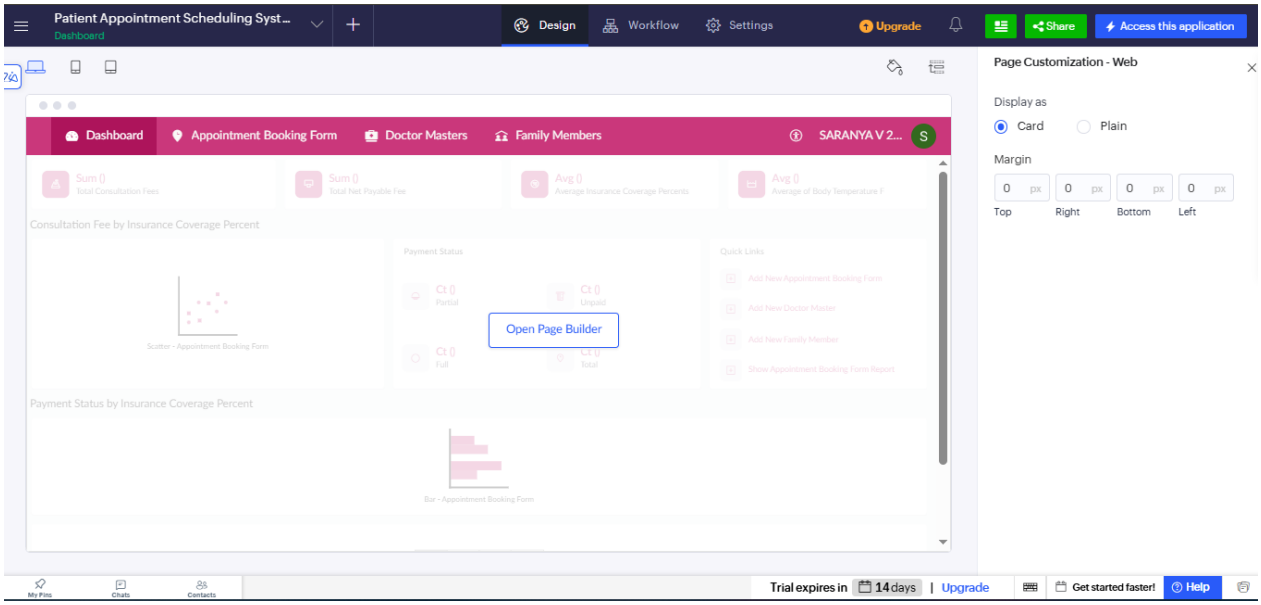

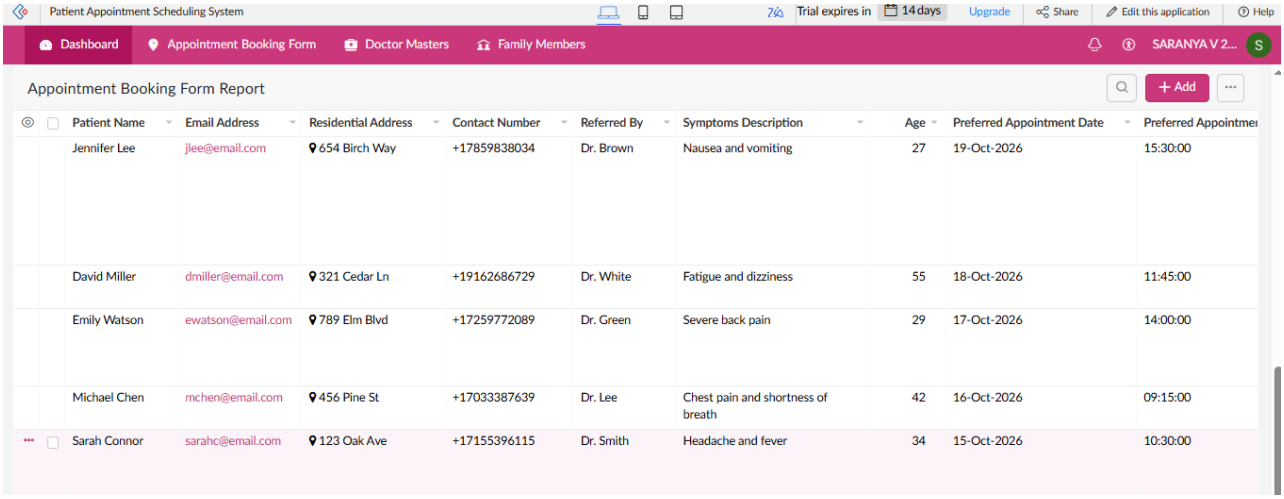

Figure 2: Dashboard page in the design preview, showing consultation-fee cards, payment-status panel, quick links and charts.

Patient Name	Email Address	Residential Address	Contact Number	Referred By	Symptoms Description	Age	Preferred Appointment Date	Preferred Appointmer
Jennifer Lee	jlee@email.com	654 Birch Way	+17859838034	Dr. Brown	Nausea and vomiting	27	19-Oct-2026	15:30:00

7. Result

The AI-assisted features and built-in analytics workflow was adapted to the Patient Appointment Scheduling System. The existing form, report and dashboard components were reviewed using the actual screenshots. Zia availability should be confirmed in the current account, and the dashboard charts/cards should be validated against populated fields before reporting numerical analytics.

8. Learning Outcome

Learnt the purpose of Zia in Zoho Creator, how form fields and field properties support data collection, and how built-in dashboard cards, charts and reports can summarize appointment information. Also learnt to verify chart sources and aggregations when analytics display empty or placeholder values.
